Executive Summary

Key Performance Indicators (KPIs) represent today an integral part of management systems across organizational levels, as they are used at strategic, operational and individual level. A KPI is a selected indicator considered key for monitoring the performance of a strategic objective, outcome, or key result area important to the success of an activity and growth of the organization overall.

The Top 25 Restaurant KPIs of 2010 report provides insights on the state of food service performance measurement today by listing and analyzing the most visited KPI examples for this industry on smartKPIs.com in 2010. It is part of the Top KPIs of 2010 series of reports and a result of the research program conducted by the analysts of smartKPIs.com in the area of integrated performance management and measurement. smartKPIs.com hosts the largest catalogue of thoroughly documented KPI examples available today and representing an excellent platform for research and dissemination of insights on KPIs and related topics. The hundreds of thousands of visits to smartKPIs.com and the thousands of KPIs visited, bookmarked and rated by members of this online community in 2010 provided a rich data set, which combined with further analysis from the editorial team, formed the basis of these research reports.

Centered around the Restaurant KPIs that in 2010 received the highest number of visits on smartKPIs.com, the "Top 25 Restaurant KPIs of 2010" report contains in addition to KPI names, a detailed description of each KPI. While dominated by Occupancy and Service KPIs, other popular examples come from areas such as Revenue, Customer feedback, Quality compliance and Cost management:

Overall, the report includes a variety of Restaurant KPIs in a unique blend. Each of the KPIs is presented individually within a KPI description form exported from smartKPIs Premium, the premium content section of the smartKPIs.com catalogue. Additional sections of the report present an overview of the use of KPIs today, the structure of the KPI documentation form and clarify the terminology specific to performance measurement.

The Top 25 Restaurant KPIs of 2010 report is a synthesis of what smartKPIs.com is all about: it forms an overview of how Restaurant KPIs are used in practice today, by combining input from the online community with analysis and insights from our research team. By discussing the use of KPIs today, presenting the best practice in documenting them and listing the most popular KPIs of 2010, the Top KPIs of 2010 series of reports are valuable resources in promoting the informed use of KPIs or refreshing the existing performance measurement and management practice in any organization.

About Key Performance Indicators (KPIs)

In many domains of human activity, the use of tools is essential for the achievement of results. Measurement and evaluation make no exception, being equipped with both conceptual and physical tools. Of the first category, at the core of any performance measurement and management system are the measures, metrics, indicators or KPIs used.

Both academic and practitioner literature uses interchangeably these terms, oftentimes even within the same organization.

At smartKPIs.com, we have adopted the following definitions for these terms:

Measure - A number or a quantity that records a directly observable value. All measures are composed of a number and a unit of measure. The number provides magnitude (how much) for the measure, while the unit gives number a meaning (what). Examples of unit measures are: dollars, hours, meters, inches, etc.

Indicator - Indicators are defined in many ways, but the common meaning for all of them is that they refer to specific information. Thus, the Organization for Economic Co-operation and Development (OECD) defines an indicator as "a qualitative or quantitative factor or variable that provides a simple and reliable means to measure achievement, to reflect changes connected to an intervention, or to help assess the performance of a development actor".1

Metric, Performance Measure or Performance Indicator - A generic term encompassing the quantitative basis by which objectives are established and performance is assessed. It helps quantify the achievement of a result, the quantifiable component of an organization's performance. In the context of measuring and managing performance these terms are use interchangeably.

Key Performance Indicator (KPI) - A selected indicator considered key for monitoring the performance of a strategic objective, outcome, or key result area important to the success of an activity and growth of the organization overall. KPIs make objectives quantifiable, providing visibility into the performance of individuals, teams, departments and organizations and enabling decision makers to take action in achieving the desired outcomes. Typically, KPIs are monitored and communicated through dashboards, scorecards and other forms of performance reports.

While on paper the terms listed above can be differentiated, in practice, the difference between them is blurred and, at some extent, irrelevant. As long as their purpose and use is clear and understood by members of the organization, whether they are called performance measures or KPIs is a matter of preference.

At smartKPIs.com, we assess each example entered in the online database and label it as measure, performance indicator or KPI. It is an empirical and subjective approach to catalogue each entry based on relevance. Ultimately, all entries in the online database are considered KPI examples. In addition, to single out the entries that stand out in terms of relevance, we introduced a new label:

smartKPI - A Key Performance Indicator example available on smartKPIs.com, that is recommended as being the most relevant and truly "Key" for organizational performance. They are selected by the editorial team of the website based on criteria such as:

- Frequency of use by Functional Area / Industry;

1. Organisation for Economic Co-operation and Development, 2002, Glossary of Key Terms in Evaluation and Results Based Management, OECD Publications, Paris, France

eabID number: sK0118171

Listing in academic and practitioner publications that analyse their usefulness;

Fulfillment of the criteria of how good KPIs should be defined and used.

KPIs ... Naturally

Measurement as a human activity is not new. It emerged in early history as a mean for discovery and sense making. Archaeologists consider the first measurement tool used in human history to be the Lebombo bone, a baboon fibula containing 29 cut notches. Dated 35,000 BC, this tally stick was discovered in the Lebombo mountains in Swaziland.

Evaluation, as a form of measurement was used as early as the 3rd century AD, when emperors of the Wei Dynasty rated the performance of the official family members. The biased nature of individual performance evaluation was noticed by Chinese philosopher Sin Yu, who reportedly criticized a rater employed by the Wei Dynasty with the following words: "The Imperial Rater of Nine Grade seldom rates men according to their merits, but always according to his likes and dislikes".

A major milestone in making the connection between measuring as a human activity and performance was in 1494, when Luca Pacioli published in Venice 'Summa de arithmetica, geometrica, proportioni et proportionalita' ('Everything on arithmetic, geometry, proportions and proportionality'). It detailed a practice the Venetian sailors had in place to evaluate the performance of their sailing expeditions, which became the basis of the double-entry accounting system.

In time, the subjective nature of individual performance evaluations and the dominance of financial indicators for evaluating enterprise performance became stepstones for performance management in human activities.

The industrial revolution added to this combination the "organization as a machine" metaphor that played a major role in driving improvements in efficiencies and effectiveness. The result was an organizational performance management model based on mechanistic, command-and-control thinking, driven by subjective individual performance assessments and financial indicators and crowned by pay-for-performance arrangements.

Did it work? To a certain extent, yes. Many organizations flourished and matured based on this model.

Does it have flaws? Many. And while historical circumstances attenuated them in time, today's environment amplifies and exposes them at an accelerated rate.

Is there a better way? Yes, but it is not simple. It requires a change at multiple levels, from the underlying philosophy of performance, to mentalities and processes. This is not easy.

Over time, the use of Key Performance Indicators (KPIs) became synonym to performance measurement and management. KPIs are the link between the old and the new in performance management. Their use, however, is much richer and rewarding in an environment based on organic performance architecture principles:

Organizations are echo-systems in their own right. They vary in terms of maturity and the environment in which they operate. As such, their use of performance management systems should reflect their own "personality". You can try to build an igloo in Sahara, but it won't be sustainable. The performance architecture of each organization needs to be unique and to reflect its internal and external environment.

Systems thinking provides a much richer context for understanding and improving performance. Command-and-control worked in time for the army, for increasing productivity of unskilled workers during the industrial revolution and for managing large organizations (such as the public service). Today, knowledge workers form the majority of the workforce in developed economies, operate in a much more interconnected environment and have to make decisions at an accelerated pace. Understanding the systems in which we operate, analyzing flow and learning based on data become ever more important today and complement the traditional simplistic managerial approach of executing orders from above.

Top 25 Restaurant KPIs of 2010

KPIs should be used primarily for learning. The role of KPIs should be the one of providing the required information to assist in navigating towards the desired results. The same principle is used by ants, who leave pheromone trails to assist each other in navigating towards the food source. Similarly, the nerve impulses travel through the different points of the nervous system, transmitting information. KPIs results should travel through the organization, facilitating communication, providing a base for analysis / synthesis and ultimately decision making across all levels of the organization.

Data accuracy in human administration is an elusive desideratum. Neils Bohr once said: "Accuracy and clarity of statement are mutually exclusive". Accuracy is a challenge in exact sciences and even more in human administration. Striving to obtain any KPI data is a challenge in itself for many organizations and data accuracy is an even bigger ask. The use of KPIs should acknowledge this aspect and be oriented towards making the most out of existent data, oftentimes by using variance intervals. This approach is used by the human body. If the temperature drops under a safe limit, we shiver. If the temperature increases, we sweat. Both are performance improvement initiatives of the body, aimed to regulate its temperature back to safe limits. The KPI here is the temperature. While it is not a constant, its trend is good when within certain safe limits.

The use of KPIs for rewards and punishment should be limited and driven by self-assessment. Purposeful oriented behaviour is a characteristic of living organisms. For humans and many other species, this behaviour is amplified by rewards and punishment. Along with this amplification, risks are amplified, too. Gaming of results, lack of cooperation, decreased morale and work accidents are some of the undesired consequences. On the other hand, the majority of nerve impulses in the human body transmit general information. Only in particular situations pleasure or pain signals. Similarly, the use of KPIs for rewards and punishment should be the exception to the rule, rather than the norm.

Embedding KPIs in organizations through visualization and communication of KPIs results is the key to maximizing their value added. Variations in the KPIs used by the human body are felt by our senses as their impact is sensory rich. Similarly, KPIs used in an organizational context should be embedded in everyday use and be a part of the working experience. The most important aspect of communicating KPI results is their visual representation. This is key, both in terms of optimizing the layout of the data representation and the presence of visual displays in the working environment. The range of media is diverse today: posters, whiteboards, banners, LED and LCD monitors should be combined to bring results to life across the organization. KPI results should not be restricted to paper reports and computer screens anymore.

New philosophy of performance, driven by self-assessment and purposeful achievement as a mean to happiness. While happiness means many things to many, a common expression of this feeling is the result of the purposeful achievement of a desideratum. Achieving something we want, while shared with others, is about us and reverberates strongly in our inner self. Transposing this powerful catalyst of performance in both our personal and organizational life is facilitated by a new paradigm: Happiness is driven by achievement. Achievement is an expression of performance. If we want to be in control of our happiness, we should be in control of our performance.

Self-assessment of performance results is not easy. However, if more emphasis is placed on building this capability in each employee, organizations can benefit by creating a rewarding environment conducive to happiness. In this environment, managers can focus on understanding and improving the working system, while employees can focus on self-assessment of the results' achievement, learning and communicating. Purposeful achievement of results in a well-structured working system would bring both individuals and organization much closer to happiness and fulfilment compared to the payment of bonuses in the current command-and-control driven dominant paradigm.

KPIs are here to stay. The question we have to answer is how do we want to use them: mechanistically or naturally?

Aurel Brudan, Performance Architect smartKPIs.com

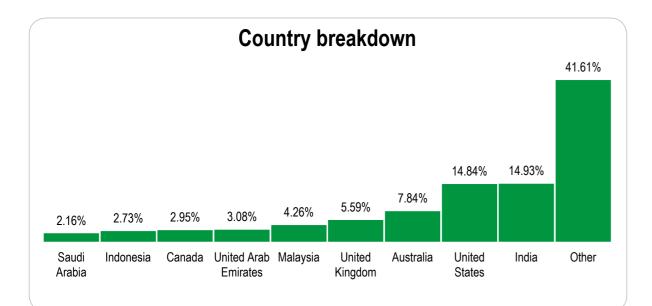

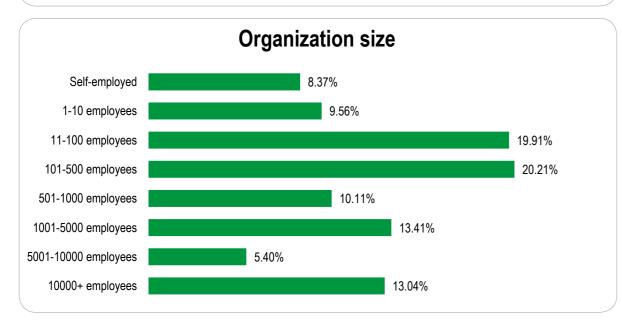

smartKPIs.com Community Profile

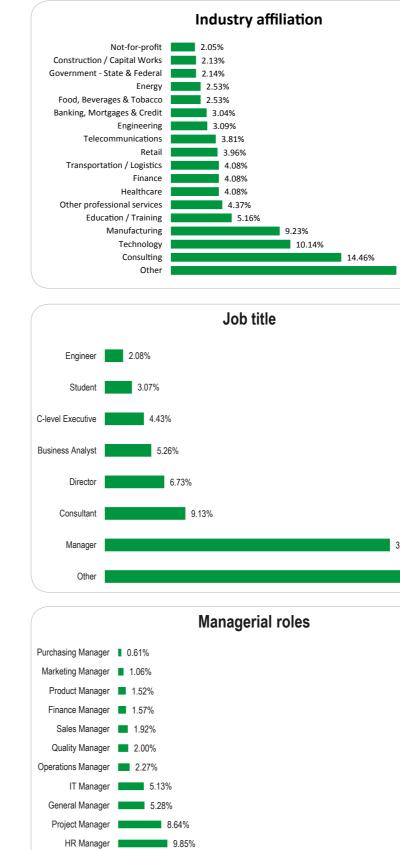

Since its launch in 2009, smartKPIs.com established itself as the favourite destination of professionals from around the world interested in high quality documented examples of performance measures. With hundreds of thousands of page views and tens of thousands of visitors from over 190 countries each month, www.smartKPIs.com is one of the most used performance management resources on the Internet.

What sets the smartKPIs.com community apart is the profile of its members.

smartKPIs.com is a truly global community, with relatively uniformly spread representation in terms of membership around the world. While the highest number of members comes from English speaking countries, no single country dominates in terms of representation. The same applies in terms of the size of the organizations to which smartKPIs.com members belong. While membership is the highest among companies with 11 to 500 employees, both small and large organizations in terms of headcount are well represented.

Food and Beverage Service as an Industry

Food and Beverage Service activities include the provision of complete meals or drinks fit for immediate consumption, whether in traditional restaurants, self-service or take-away restaurants, whether as permanent or temporary stands, with or without seating. Also, it can include the service of food and beverage to a group as part of an organized event, where services occur to all guests within a specific time frame. The traditional format for entities operating in this industry are restaurants, whose operation require a higher degree of complexity.

For the purpose of navigating around the KPI examples listed in this report, they have been grouped in the following categories:

- Occupancy, covering aspects such as guest numbers and reservations;
- Service, grouping menu and labour related KPs;
- Revenue, linked to several variables;
- · Customer feedback, covering aspects related to guest satisfaction;
- · Quality compliance, with principles and practices regarding industry regulations (such as safety and sanitation) and industry bestpractices (menu planning, environmental awareness etc.);
- Cost management, grouping KPI examples used for the analysis and optimization of expenses.

History

The hospitality industry and, in this context, food and beverage service side of it, is considered to be one of the oldest, with records of its existence being traced back in ancient times. The industrial revolution from the 18th century and the technological and social changes it has generated enhanced the development of the food service industry. The growth of cities and the introduction of technologies that made possible a better conservation and transportation of food lead to an increasing demand for food service on the market.

Nowadays, the food and beverage service industry is one of the most regulated in terms of norms that restaurants and similar facilities have to comply with, in order to ensure customer safety and a proper sanitation of products and operations. On the other hand, it has benefited from technological developments and a diversification of customer needs and demands that made possible the emergence and development of a great variety of food service facilities, to address the needs of any customer group and budget.

However, the economic conditions over the last years provided a difficult operational environment, with restaurant managers around the world, having to face lower customer demand as customers cut spending. The use of KPIs in this context is timely as they can assist in making decisions about the efficiency and effectiveness aspects of operating a restaurant.

Top 25 Restaurant KPIs of 2010 – Countdown Analysis

% Front of house labor

The wining and dining experience is based not only on food quality and service, but also on the ambiance. Ensuring the condition of the establishment is up to standards at all times requires time allocated to front of house work. This KPI is useful in finding the right balance for staff time allocation.

% Beverage loss

Value generation in a restaurant context is both about increasing revenues and reducing costs. Monitoring food and beverage loss is a common practice in the industry, supporting efforts for cost reduction and efficiency improvements.

Product quality uniformity

Ensuring customer satisfaction relies on providing products of consistent quality every time. Monitoring this is popular both at individual location and chain level.

Guests

Monitoring the volume of guests that have to be served, especially in time intervals where table occupancy is high, is important in order to plan and optimize personnel and the other resources so as to offer impeccable service.

New menu items

A popular KPI for restaurants that pride themselves as innovators and position themselves as such. For this market segment adding new menu items represents an R&D KPI that contributes to their branding. For other segments, menu decisions are exclusively pragmatic and changes are driven by profitability.

% Food costs from food sales

Another cost management KPI example, used in monitoring value generation. In markets with high food price variability, such KPIs serve monitoring profitability and ensuring actions are taken to maintain it.

% Tips from total collected

In some markets (such as in the US), tips are part of the culture and of the social contract, being important component of remuneration. They can be useful indicators of customer satisfaction and buying power, thus their monitoring is popular across markets.

8 % Sin

% Food loss

Similar to % Beverage loss, a cost management KPI used for cost management and supporting efficiency improvements.

% Food service strike rate

Achieving high levels of revenue per available seat hour (RevPASH) depends on how much the guests consume, which will determine the revenue they generate. Having high numbers of guests, but with low bills will lead to low levels of RevPASH. In this context, the solution is to increase order numbers, by ensuring more guests consume at least a menu item during their visits.

\$ Amount of dining

Increasing the revenue achieved by restaurants can be done either by gaining new guests, or by stimulating them to buy more. Mainly in the case of luxury restaurants, monitoring the average amount of a dining bill can offer insights into the guests' profile and how to increase the value of these guests.

Purchasing operations are very importa

Purchasing operations are very important for any business in the food and beverage service industry. Due to the health implications and subsequent regulations in the field, having sound purchasing practices and handling processes for ingredients is vital.

Time per table turn

A key value driver for any restaurant is to achieve the revenue per available seat hour (RevPASH) as high as possible. In order to do so, tight monitoring of the average time spent by a guest or a group of guests at a table enables insights into how to optimize table occupancy and improve RevPASH.

\$ Revenue per table

Monitoring this KPI enables the assessment of how much revenue a table from the food and beverage service facility generates in a particular time. This analysis is mainly helpful in comparing the revenue generated by a table in different time intervals of the day or week.

12

% Restaurants that apply principles of menu planning

Applying principles and practices of menu planning enables restaurant managers to better organize their activities and offer superior service in terms of quality and diversity of menu items. Many restaurant chains monitor this KPI in order to assess the extent at which the units in the chain implement menu planning practices, as an industry best practice.

Page 14

© eab group Pty Ltd 2011

eabID number: sK0118171

% Restaurants that apply principles of managing the purchasing process

% Unavailability of menu items

Offering high quality services requires restaurants to satisfy customer needs and this KPI offers insights regarding the extent at which these needs are satisfied. Ordering items that are not available to serve will probably lead to guests' dissatisfaction as it reflects poorly on the administrative and customer service capabilities of the venue.

% Restaurants that apply principles of workplace safety and sanitation

Compliance with legal regulations is a necessity for units in the food and beverage industry. Hence, in the case of restaurant chains, the percentage of restaurants that apply principles of workplace safety and satisfaction is a key indicator of compliance and care for the employees and guests.

% Customers satisfied with the time to be served

A fast service is a key driver of success in the restaurant industry as it impacts both customer satisfaction and profitability. Monitoring this KPI is a must for any restaurant interested in gaining insights from customers on the dining experience.

\$ Revenue per available square meter (RevPAM)

Monitoring RevPAM is useful in assessing how well the available space is organized in order to optimize revenue. While overall revenue differs from one food service unit to another, depending on its profile, RevPAM offers a benchmark to which different restaurants can compare and see how well they are performing, no matter the total surface they use and their total revenue.

Tables served per waiter

Maintaining a balance between the number of waiters and the volume of tables and guests they need to serve is important from both employee and guest satisfaction perspectives. Having too few waiters serving too many tables can lead to poor quality of service, increased time to serve guests and employee work overload.

Guests per table

Monitoring this KPI provides insights about the demographics of customer groups that can be used for market positioning and for organizing the space to fit customer profiles. If most of the customers are couples and most of the tables cater for groups of 6+ people, here is a misalignment that needs to be addressed.

% Reserved tables

By monitoring the extent at which restaurant tables are reserved, this KPI illustrates the interest of guests in the restaurant. Having high levels of tables occupied with reservations indicates that the restaurant is attractive and can further on help plan occupancy of tables.

eabID number: sK0118171

eabID number: sK0118171

© eab group Pty Ltd 2011

© eab group Pty Ltd 2011

% Positive feedback from guests

Guest satisfaction and loyalty is a key focus for each food service unit. Hence, measuring and tracking feedback from restaurant guests must be done permanently and must be used as foundation for improving service. Positive feedback from guests is recognition of high standards in service delivery and a leading indicator of guest satisfaction.

Complaints per restaurant order

Thorough monitoring of guest satisfaction and complaints is a practice that any food and beverage service unit should employ. This KPI offers insights regarding the frequency of complaints relative to the orders serviced.

% Canceled reservations

Tracking the reservations that are canceled is important in order to optimize occupancy through table reallocation and for the improvement of reservation standards. If using a reservation management system, data collection and reporting can be done with ease.

\$ Revenue per available seat hour (RevPASH)

RevPASH is one of the most popular KPIs in the food and beverage service industry, being the correspondent of RevPAR in the hotel industry. While revenue optimization is a key preoccupation for any food service manager, monitoring this KPI can be useful for maximizing the revenue-generation capacity of the seats available.

| N/A | Food and Beverage Service | Hospitality & Tourism |
| KPI record | Indicator type | Unit type |
| sK4753 | Key Performance Indicator | \$ |

Name

\$ Revenue per available seat hour (RevPASH)

Definition and variations

Definition

Measures the restaurant's revenue on a per available seat hour basis. The volume of available seat hours refers to the number of seats available for guests, multiplied by the number of hours of operation.

Variations

- \$ RevPASH
- \$ Revenue per available seat hour

Related KPIs

\$ Revenue per available treatment room (RevPAT)

Tags

revenue

Calculation

Subordinate measures used for calculation

- A = \$ Revenue
- B = # Available seat hours

Calculation formula A/B

Formula type Average

Trend is good when Increasing

Focus

Purpose

It is used in revenue management in order to analyze the overall efficiency in seating and selling the products to customers, identifying the most and least efficient serving intervals.

| BSC perspective | Measurement focus | Impact stage |
|-----------------|-------------------|--------------|
| Financial | Money | Output |
| Indicator focus | Measurment type | Level |
| Lagging | Quantitative | Operational |
| | | |

Data profile

| Data capture period | Standard reporting frequency | Data integrity |
|-------------------------------|------------------------------|----------------|
| Day | Monthly | Medium |
| Automation fit Recommended | | |

Targets Benchmarking fit Notes Suitable Calculation envisages a daily average (that encompasses all operating hours within the daily operating program), but also the RevPASH for each operating hour (calculated as the division of the hourly revenue to the number of available seats within that hour). Further on, each hourly RevPASH is compared to the daily average to see which time intervals are the most productive (i.e. with hourly RevPASH above the daily average). Threshold exemple Red: <20 Yellow: 20-30 Green: >30 Analysis and resources **Overall notes** It represents one of the newest measures of restaurant productivity, developed and advocated by Dr. Sheryl Kimes of Cornell University.

RevPASH increases can be stimulated by increases in seat turnover (serving more customers in an hour increases the revenue achieved in that hour). Also, restaurant managers can increase RevPASH by offering incentives during the time intervals (hours) when less diners visit the restaurant.

Trend is good when Decreasing

Purpose

Focus

To indicate how much of the potential revenue that could be generated by all the bookings within a given time period will become actual revenue for the organization

| BSC perspective | Measurement focus | Impact stage | |
|---|--|--------------------------|--|
| Customer | Volume | Process | |
| Indicator focus | Measurment type | Level | |
| Leading | Quantitative | Operational | |
| Data profile Data capture period Week | Standard reporting frequency Weekly | Data integrity Medium | |
| Automation fit | Limitations | Weddin | |

Recommended For increased relevance, reporting should be done as often as possible, so as to allow re-booking.

eabID number: sK0118171

Overall notes

In the case of hotels, the analysis should be complemented by measuring the time horizons at which the cancellation is made after the moment of booking. If the cancellation is done quickly after the booking, there is the possibility of re-booking, so there will be no loss. If done right before the due arrival, the room might not be re-booked, but in most of the cases the money paid in advance is not returned by the hotel.

booking operations

Calculation

Subordinate measures used for calculation

A = # Times the tables are occupied with prior reservation B = # Times the tables are occupied

Calculation formula (A/B)*100

Formula type Rate

Trend is good when Increasing

Focus Purpose

It is a measure of restaurant attractiveness, as booking restaurant tables means that people want to avoid the risk of not finding a free table.

| BSC perspective | Measurement focus | Impact stage |
|----------------------------|------------------------------|----------------|
| Customer | Volume | Process |
| Indicator focus | Measurment type | Level |
| Leading | Quantitative | Operational |
| Data profile | | |
| Data capture period | Standard reporting frequency | Data integrity |
| Day | Weekly | Low |

Automation fit Limitations Not recommended While reservations can easily be monitored, accurate reporting requires constant monitoring of how many times each table is occupied, whether or not with prior reservation.

Page 26

eab group

eabID number: sK0118171

Targets Benchmarking fit Notes Suitable It is one of the most suitable metrics for comparison to competitor restaurants, as it is well known that customers make reservations to best recognized and busiest restaurants Threshold exemple Red: <40% Yellow: 40-60% Green: >60% Analysis and resources Overall notes Usually, based on prior results for this metric, restaurant managers plan their tables by allocating some of them to reservations, and the rest to walk-ins. It is argued that high levels of reservations occur also in the case of expensive restaurants, where people with checks of large value want to plan their night, they don't want to just drop in somewhere. Also, it is argued that the use of technology enhances the volume of reservations for restaurant tables.

A = # Customers stating they are satisfied with the time it took to serve them B = # Customers

| alculation formula | |
|--------------------|--|
| A/B)*100 | |

Formula type Rate

Trend is good when Increasing

Focus

Purpose

To indicate whether the internal flow for serving the customers meets their expectations in terms of time they have to wait to be served.

| BSC perspective Customer | Measurement focus Satisfaction | Impact stage Outcome |
|--|---|-------------------------|
| Indicator focus Leading Data profile | Measurment type Quantitative | Level Operational |
| Data capture period | Standard reporting frequency | Data integrity |
| Day | Monthly | Low |
| Automation fit | Limitations | |
| Recommended | It is highly based on customer subjectivity. The satisfactorily time they have to wait to be served can vary from one customer to another, depending on their personality or whether they are in a rush or not. | |

Targets Benchmarking fit Notes Unsuitable The time to serve is suitable for comparison to both competition and to the same unit's results in previous periods to check whether improvements in the serving flow have been made. However, customer perception in this context is subjective, thus benchmarking is not suitable. Threshold exemple Green: >95% Red: <95% Yellow: 85-95% Analysis and resources

Overall notes

The metric is also highly susceptible for the halo effect. A customer that has not been satisfied with the service or the food quality, might express dissatisfaction in respect to anything asked.

Measurement is easy, as it can be done by simply asking customers to fill in at leave a brief form asking them to state whether they were satisfied or not or to rank in a scale, with values like: Excellent, Good, Medium, Bellow average, Poor.

Automation fit Recommended

Correct calculation requires laborious work, encompassing both food purchases in period and the adjustment in the food inventory. In practice, it is argued that many restaurant managers miscalculate this metric by computing incorrectly the food inventory or even by omitting it.

Trend is good when

Decreasing

Data integrity

Medium

| Notes |

| Targets can be seriously inventory level. |
| |
| Yellow: <30%; 40-50% |
| |
| |

Evaluating at each measurement period the value of both the beginning and the ending inventory is laborious and time-consuming. Thus, in practice we can find restaurant managers using average figures, determined after several real measurements and used from then on, of course, adjusted from time to time with new real measurements.

| Overall notes | |

Although costly (raising food and labor costs because of decreasing economies of scale), menu diversity and constant change is a must for nowadays food service facilities, representing one of the main aspects of restaurant planning practices.

Depending on its profile and possibilities, each food service unit should diversify the menu from time to time, preferably with own-created recipes.

| Analysis and resources | |

Overall notes

Along with being a measure of popularity, the number of guests is used in constructing many other performance measures, such as the average revenue per guest, number of guests per employee etc.

It is one of the most useful KPIs in the context of revenue management, and can provide valuable insights for decision-making. It can help project the revenue or the RevPAR or RevPASH and provide incentives to stimulate demand in less attractive time intervals.

Overall notes

There are a number of ways of studying the quality attributes of food products. One way is to look at the occurrence of the characteristics as the product is encountered and consumed. Using this system, quality attributes are often classified as external (sight, touch, defects), internal (odor, taste, texture), or hidden (wholesomeness, nutritive value, safety).

Appendix B: Related Reports

Appendix A: Glossary of Terms

The following list provides an explanation of several popular terms characterizing KPIs:

Rate – A specific type of ratio expressed in many cases as part to whole. Examples of rates are the natality or mortality rate, expressed as the number of births or deaths per a certain number of population or the currency exchange rate, where the value of one currency is compared to the value of the other currency.

Ratio – A relation between two measures that might be distinct, but which are part of the same category of elements, such as the ratio of boys to girls, teachers to students, doctors to patients, revenues to expenditure.

Composition – A composite indicator is formed when individual indicators are compiled into a single index, on the basis of an underlying model of the multi-dimensional concept that is being measured. It measures multi-dimensional concepts (e.g. competitiveness, e-trade or environmental quality) which cannot be captured by a single indicator.

Index – A number computed from a specific formula or calculation methodology, used to characterize a complex set of data.

Leading – Drive the performance of the outcome indicators, being predictors of success or failure. Examples of leading indicators are: "% Employees involved in the innovation process", "% Conversion rate" or "% Inventory quality ratio (IQR)".

Lagging – Type of indicators that reflect the success or failure after an event has been consumed. Examples include: "\$ Operating profit per room", "\$ Earnings before interest and taxes (EBIT)" or "\$ Cost avoidance savings".

Input – Reflects assets and resources invested in or used to generate business results. Examples include: "# Headcount", "\$ Cost per broadcast hour" and "# Knowledge materials distributed to employees".

Process – Refers to the efficiency or productivity of a business process. Examples include: "% On time delivery", "# Conflicts arisen during the project", "# Average call handling time" and "# Mean time to repair".

Output – Measures the financial and nonfinancial deliverables or results of business activities. Examples include: "% Passenger seats sold", "# New customers acquired" or "\$ Revenue per successful call".

Outcome – Reflects overall results or impact of the business activity in terms of generated benefits, as a quantification of performance. Examples include: "% Customer retention", "% Employee turnover", "\$ Net income after taxes (NIAT)" or "% Brand awareness".

Qualitative – A descriptive characteristic, an opinion, a property or a trait. The most common ones gauge customer or employee satisfaction through subjective assessments. Based on a subjective interpretations of a customer's or employee's opinions. Oftentimes these type of indicators are not expressed numerically, but as narrative text. Sometimes a rating is allocated do rank between levels (i.e. Likert scale).

Quantitative – A measurable characteristic, resulted by counting, adding or averaging numbers. Quantitative data is most common in measurement and therefore forms the backbone of most KPIs. Operational systems that manage inventory, supply chain, purchasing, orders, accounting, financial systems, all gather quantitative data by means of KPIs. Other examples of quantitative KPIs are "# Employee tenure", "# Units per man-hour" or "# Maintenance backlog".
